2. Reachability Game

Motivation & References

Motivation: Reachability and Büchi games are important in system verification and testing. Computing the winning set of Büchi games is a central problem in computer aided verification with a large number of applications.

Motivation & References

Reachability Game

A reachability game is a 2-player (namely P0 and P1) game on a directed finite graph.

Game graph: directed graph $G(\{V_0 \cup V_1\}, E).(\{V_0, V_1\})$ is a partition of V)

Target set: target set is $T \subseteq \{V_0 \cup V_1\}$.

A play P is a (finite or infinite) path in the game graph beginning at the initial vertex s. If $v \in V_0$, P0 moves along an outgoing edge of v. Otherwise, P1 takes the move.

Definition of winning: P0 wins if $T \cap P \neq \emptyset$, otherwise P1 wins.

Memoryless strategy: a strategy for P0 is a mapping $\alpha: V_0 \to V$ that defines how P0 should extend the current play.

Motivation & References

Reachability Game

Example for Reachability Game

Rectangle vertices are in V_1 , circles are in V_0 ; Vertices in T are red, the initial vertex v_I is blue. Motivation & References

Reachability Game

Büchi Game

A winning play for P0 is $\{5,3,1\}$

Algorithm for Reachability Game

Motivation & References Reachability Game Büchi Game

- if s is in T, P0 wins;
- if $s \in V_0$ and s has at least one outgoing edge to $u \in T$, P0 wins in one step;
- if $s \in V_1$ and all of s's outgoing edges go to $u \in T$, P0 wins in one step;

Reachability and Büchi games

Algorithm for Reachability Game

We defined Rank 0 and Rank 1 already, now we define Rank i. $R_i := \{v \in V | \text{ P0 can force a visit from v to a vertex in } T \text{ in i steps} \}$

Define Reachability set of T for P0, $Reach(T,0) := \bigcup_{i=1}^{n-1} R_i$

A vertex $v \in R_i$: if $v \in V_0$ and there is an edge e(v, u) $u \in R_{i-1}$; if $v \in V_1$ and for every edge e(v, u) we have $u \in \bigcup_{i=0}^{i-1} R_j$; Motivation & References

Reachability Game

Algorithm for Reachability Game

Reachability Game

Büchi Game

• $R_0 = \{1, 2\};$ • $R_1 = \{5\};$

•
$$R_2 = \{3\};$$

•
$$R_3 = \{4\};$$

•
$$R_4 = \{6\};$$

For simplicity, denote $u \in R_k$ by Rank[u]=k.

An O(m) Algorithm for Reachability Game

	Algorithm 1: Reachability for P0	Motivation & References
	Data: game graph G , target set T	
	Result: Rank[V]	Reachability Game
1	Q:= an empty queue;	DULLO
2	Rank[V],count[V]:= all 0s array;	Büchi Game
3	Q.push(T);	
4	while Q is not empty do	
5	u:=Q.front,Q.pop;	
6	for $e(v,u)\in E$ do	
7	if $v \in V_0$ and v has not been visited then	
8	$ Rank[v]:=Rank[u]+1; Q.push(\{v\})$	
9	else if $v \in V_1$ then	
10	<pre>count[v]:=count[v]+1;</pre>	
11	if $count[v]=Out Degree of v$ then $Rank[v]:=Rank[u]+1$; Q.push($\{v\}$);	
12	end	
13	end	
14	end	

Every edge is used at most once.

Туре

 T_1,T_2,\ldots,T_k are disjoint subsets of V, now we want to compute Reachability of each one of them.

Büchi Game

Definition A type of vertex x is a tuple (y_1, \ldots, y_k) , where each $x_i \in \{0, 1\}$, such that $y_i = 1$ iff x is in $Reach(T_i, 0)$.

Compute Types

Motivation & References

Reachability Game

- Run reachability algorithm for every T_i , O(km);
- Compute simultaneously.
- Can it be done in linear or nearly linear time?

Minimum Base

The minimum base of T is the minimum subset of T which can generate the same Reachability set as T.

Computing the minimum base is NP-hard.

Set cover problem: Given a set S of n elements, a collections $S_1, S_2, ..., S_m$ of subsets of S, and a number K, does there exists a collection of at most k of these sets whose union is equal to all of S.

Reachability Game

Büchi Game

Motivation &

Minimum Base

Proof:

We prove that the decision problem for minimum base is NP-Complete. The decision problem L is can we find a base with at most k vertices.

- 1 L is in NP.
- **2** set cover problem(which is NP-Complete) can be reduced to *L* in polynomial time.
 - Construct a Reachability game graph $G(V_0, E)$. There are m vertices in T representing m subsets in set cover problem, n vertices not in T representing n elements in S.
 - If subset S_i contains element x_j , connect an edge from vertex representing S_i to vertex representing x_j in T.

Motivation & References

Reachability Game

Minimum Base

So L is NP-Complete. The minimum base problem is NP-Hard.

Büchi Game

Motivation & References

Reachability Game

Büchi Game

Definition A **Büchi game** is a game $\mathcal{G} = (G, s, T)$ where G is the Reachability game graph, V_i is an initial vertex, $T \subseteq V$ is the target set as in Reachability game.

Play: The definition of play in Büchi Game is the same as in Reachability game.

Definition of winning: We assume the play P is infinite here. if there exists infinite many vertices $v \in T$ in P, P0 wins. Otherwise P1 wins.

Example for Büchi Game

Motivation & References

Reachability Game

Büchi Game

P0 is always winning on this game graph.

	Reach(T,0)	
T		
±	G	<u> </u>]

If $v \notin Reach(T, 0) \cup T$, v can not reach T, P0 will lose.

Some vertices in T can not reach $Reach(T,0)\cup T, \ {\rm P0\ will}$ also lose on these vertices.

Motivation & References Reachability Game

T_1 .	$Reach(T,0)\backslash Reach(T_2,0)$)
T_2	$Reach(T_2, 0)$	

$$\begin{split} T_1 &= \{ v \in T | v \text{ can't reach} \\ T \cup Reach(T,0) \} \end{split}$$

Motivation & References Reachability Game

Büchi Game

Some vertices in T_2 can only reach $Reach(T, 0) \setminus Reach(T_2, 0)$

We find $T_3 = \{v \in T_2 | v$ can't reach $T_2 \cup Reach(T_2, 0)\}$

Motivation & References

Reachability Game

Büchi Game

T_1 I	$Reach(T,0) \backslash Reach(T_2,0)$)
Winning	set for P0	
	G	

We repeat this process until T_k does not shrink.

The remaining part of $T_k \cup Reach(T_k, 0)$ is the winning set for P0.

- How to find T_1 $T_1 = \{v \in T | v \text{ can't reach } T \cup Reach(T, 0)\}$ $T_1 = \{v \in T | v \text{ can only reach } V \setminus \{T \cup Reach(T, 0)\}\}$ P1 wants to reach $V \setminus \{T \cup Reach(T, 0)\}\}$, P0 tries to avoid $V \setminus \{T \cup Reach(T, 0)\}\}$. compute $Reach(V \setminus \{T \cup Reach(T, 0)\}\}$, 1)
- Time complexity

O(m) to find T_i , at most O(n) times. Worst-case O(nm).

Motivation & References

Reachability Game

Compute C_0 and C_1 .

 C_0 is a set of vertices in $V_0 \setminus T$ having all outgoing edges to vertices in $V \setminus T$. C_1 is a set of vertices in $V_1 \setminus T$ having an outgoing edge to vertices in $V \setminus T$.

Compute $Reach(C_0 \cup C_1, 1)$ Motivation & Reachability Game

Some vertices in $Reach(C_0 \cup C_1, 1)$ can "reach" $T_1.(D$ in the left picture)

Compute $Reach(T_1 \cup D, 0)$.

 $E = Reach(C_0 \cup C_1, 1) \setminus \{T_1 \cup D \cup Reach(T_1 \cup D, 0)\}$

 $\{E \cup C_0 \cup C_1\} \setminus Reach(T_1 \cup D, 0) \text{ is the set of vertices}$ which can't "reach" T.
Reachability and Büchi games

Yu Cong

Motivation &

Reachability Game

References

$$\begin{split} S &= \{E \cup C_0 \cup \\ C_1\} \backslash Reach(T_1 \cup D, 0) \text{ is } \\ \text{the same as} \\ V \backslash \{T \cup Reach(T)\} \text{ in } \\ \text{Algorithm 1.} \end{split}$$

Then we can compute Reach(S, 1) to delete some losing vertices for P0 in T.

Repeat the same process on $G \backslash \{T \backslash Reach(S,1)\}$

Motivation & References

Reachability Game

Büchi Game

• Time complexity

Finding S needs O(m) time. Also in the worst case we need to compute S O(n) times. worst case O(nm).
